Farming and Farmkeeping.

SODS.

There are few weeds more troublesome than sods, or more difficult to eradicate. Experience, however, seems to show that marling or liming, in a proper way and in sufficient quantity, will destroy the pest, and prevent its future development. The growth of sods is the result of acidity in the soil, and lime, by its alkaline and retarding action, tends to neutralize and correct. The growth of sods is far more common on light, sandy soils, or of an antiscorbutic character, than on lime formations, where, indeed, it rarely appears. The quantity of lime that is economically applied to the soil is a question to be decided by trial. It is rarely the case that agricultural soils, or those containing a large percentage of clay, produce this plant, although such is sometimes the case. Whenever it appears, the immediate application of lime and tillage is the only remedy. Too much cannot be said in favor of lime as a manure. In all composts, and for whatever uses designed, it should enter as an ingredient—the quantity being of course graduated by the character and capacity of the soil, and the nature of the crop being in a majority of cases merely a collateral consideration. In the reduction of green vegetable matter, the use of quick lime is, indeed, indispensable. The best produced by it in the kitchen garden, and in the field, is the result of its decomposition and the breaking up of the vegetable structure more effectually than can be effected by any other process.

STRAW STACKS.

Straw stacks, from early threshing grain, should be made as carefully as stacks of hay. Straw is valuable in many ways, being always readily eaten by stock in the winter, and is well worth saving, bright and clean, instead of being thrown into irregular heaps, to become irregularly soaked with rains, and spoiled for all practical use. It is rare to see a properly constructed straw stack, though any man of ordinary skill can make one. The main point is to get good-sized bales to place promptly round the outside, and another series of smaller bales to put inside and partly on top of it to bind the outside tier. Tread firmly and keep the middle well filled. It is better to arrange to put all the straw in one large stack, rather than in two or three small ones, and it is better to have it a little too high than too wide with a flat roof. It may take an extra man to make the high roof, but it will pay. Another point to be specially attended to is to throw the chaff into the middle of the stack, or at least not to leave it in a heap where it drops from the carrier. The weak spot in the stack, and where the rain is almost sure to do the most damage, is on the side next the carrier. Special care should be taken to get the chaff and short straw away and to build up around the carrier with long straw.

APPLE TREES.

Many otherwise good orchards are allowed to become neglected, as we are often injured, by allowing a profusion of suckers to grow at the base of the trunks. Attempts are sometimes made to get rid of them by cutting them off down to the surface of the ground, leaving considerable portions in the form of short stumps. These sprout again, and they soon become as bad as ever. A better way is to wait till they are in leaf, at which time they are loosened more readily, and taking each separately in the hands, and placing a thick boot upon it near the tree, they are quickly severed. If done at the time they will not be likely to sprout again.

It is a well-known truth in horticulture.

to be sure the tree is raised from one that was budded on a seedling stock. Too many of our tree growers gather up suckers from their grounds and use them on these trees, which must reproduce a bad tree. Never bud on a sucker. Root grafting also produces them. This, too, is a bad practice.

FARMERS!!!

TRY THE

ALTA VELA PHOSPHATE!!!

It is composed principally of the celebrated ALTA VELA.

Contains three per cent. of AMMONIA, an ample quantity to give activity without injury to the vegetation, and a large quantity of soluble

BONE PHOSPHATE OF LIME, the essential elements of

COMPLETE MANURE.

The full cultivation in which it is held by the many thousands of farmers who are using it, has produced the best results.

PRICE, \$3.00 PER TON OF 10 BAGS, OR \$1.00 PER BAG.
